EN ROUTE
RADAR ASSOCIATE
CONTROLLER TRAINING PART B:
NONRADAR***

Lesson 2: Lateral Separation

Version: 1.0 2022.08

PAGE INTENTIONALLY LEFT BLANK

LESSON PLAN DATA SHEET

Course Name	En Route Radar Associate Controller Training Part B: Nonradar
Course Number	55054002
Lesson Title	Lateral Separation
Duration	1 hour (Includes lesson and ELT)
Version	1.0 2022.08
Reference(s)	JO 7110.65, Air Traffic Control; JO 7400.2, Procedures for Handling Airspace Matters; FAA Order 8260.3, United States Standard for Terminal Instrument Procedures (TERPS); 14 CFR Part 71, Designation of Class A, B, C, D, and E Airspace Areas; Air Traffic Service Routes and Reporting Points; FAA-H-8083-25B, Pilot's Handbook of Aeronautical Knowledge
Handout(s)	NONE
Exercise / Activity	NONE
Scenario	NONE
Assessments	☉ YES - Written
Materials and Equipment	☉ Pencil and/or pen
Other Pertinent Information	☉ Ensure lesson materials are downloaded to the classroom computer ☉ This lesson is based on ERAM EAE410 ☉ The lesson has been reviewed and reflects current orders and manuals as of April 2022

LESSON PLAN ICONS

	Description
	The Activity icon indicates an exercise, lab, or hands-on activity.
	The Discussion Question icon signals a discussion question to be asked to the students.
	The Handout icon indicates a handout is to be distributed to the students.
	The Instructor Note icon is in hidden text and indicates text that is for the instructor only.
	The Multimedia icon indicates a video or audio clip is in the presentation.
	The Phraseology icon indicates that phraseology is in the content.
	The WBT icon indicates a component of web-based training.
	The Click icon indicates a PPT slide with click-based functionality to present additional information.
	The Definition icon indicates a published definition.

PAGE INTENTIONALLY LEFT BLANK

LESSON INTRODUCTION

Overview

Your proficiency at using lateral separation in conjunction with vertical separation will help resolve traffic situations as they become more complex throughout your training.

This lesson will cover lateral separation and its application in air traffic control situations.

LESSON INTRODUCTION (CONT'D)

Lesson Objectives

Objectives

At the end of this lesson, you will be able to identify:

- Lateral separation methods
- Protected airspace of routes and course changes
- Separation minima on diverging radials or tracks
- DME arc separation minima

Lesson 2: Lateral Separation

1

Objectives

- ⦿ At the end of this lesson, you will be able to identify:
 - Lateral separation methods
 - Protected airspace of routes and course changes
 - Separation minima on diverging radials or tracks
 - DME arc separation minima

NOTE: There will be a graded end-of-lesson test upon completion of the lesson. The passing score is 70%. If you do not achieve a score of 70%, you will be provided study time and one retake of an alternate end-of-lesson test.

LATERAL SEPARATION METHODS

Lateral Separation Methods

JO 7110.65, par. 6-5-1

Lateral Separation Methods

- Clear aircraft via one of the following separation methods:
 - Different airways or routes
 - Different geographic locations
 - Hold over different fixes
 - Holding patterns and airways or routes that do not overlap

 Lesson 2: Lateral Separation 2

Lateral Separation

- ⊙ Clear aircraft via one of the following separation methods:
 - Different airways or routes
 - Different geographic locations
 - Hold over different fixes
 - Holding patterns and airways or routes that do not overlap
-

LATERAL SEPARATION METHODS (CONT'D)

Separation by Different Airways or Routes

JO 7110.65, par.
6-5-1

Separation by Different Airways or Routes

- Clear aircraft on different airways or routes whose widths or protected airspace do not overlap
-

LATERAL SEPARATION METHODS (CONT'D)

Separation by Geographical Location

JO 7110.65, par. 6-5-1

Separation by Geographical Location

- ⦿ Clear aircraft below 18,000' to proceed to and report over, or hold at different geographical locations determined:
 - Visually
 - or
 - By reference to NAVAIDs
-

LATERAL SEPARATION METHODS (CONT'D)

Separation of Holding Patterns

JO 7110.65, par. 6-5-1

Separation of Holding Patterns

- ⦿ Clear aircraft to hold over different fixes whose holding pattern airspace areas do not overlap each other, or other protected airspace
 - ⦿ If holding pattern airspace areas overlap, do not hold aircraft at the same altitude
-

LATERAL SEPARATION METHODS (CONT'D)

Separation Between Holding Patterns and Airways or Routes

JO 7110.65, par. 6-5-1

Separation Between Holding Patterns and Airways or Routes

- ⦿ Clear aircraft to hold at a fix when the protected airspace does not overlap the protected airspace of airways or routes
 - If the protected airspaces overlap, do not hold aircraft at the same altitude as aircraft on the airway or route
-

LATERAL SEPARATION METHODS (CONT'D)

Effect of Altitude and Speed

FAA Order
8260.3, par. 16-
3-3, table 16-3-1

Effect of Altitude and Speed

⊙ Holding pattern protected airspace area increases with greater:

- Altitude
- Speed

NOTE: When holding patterns are designed, the speed and holding altitudes are taken into consideration.

LATERAL SEPARATION METHODS (CONT'D)

Knowledge Check

Knowledge Check

The protected airspace of a holding pattern must not _____ of an airway.

- A. parallel the protected airspace
- B. overlap the centerline
- C. overlap the protected airspace

 Lesson 2: Lateral Separation  8

Question: The protected airspace of a holding pattern must not _____ of an airway.

LATERAL SEPARATION METHODS (CONT'D)

Knowledge Check

Knowledge Check

What causes the size of a holding pattern to increase?

- A. Greater temperature and speed
- B. Lesser altitude and precipitation
- C. Greater speed and altitude

 Lesson 2: Lateral Separation  9

Question: What causes the size of a holding pattern to increase?

PROTECTED AIRSPACE OF ROUTES AND COURSE CHANGES

Established Airways and Routes

FAA Order
8260.3, par. 14-1-2

JO 7400.2, pars.
20-3-3, 20-4-3

Established Airways and Routes

- ⊙ Protect airspace along established airways or routes as follows:
 - From 4 miles either side of centerline to 51 miles from NAVAID, then:
 - Diverging angle of 4.5° from NAVAID to changeover point
 - No maximum width
-

PROTECTED AIRSPACE OF ROUTES AND COURSE CHANGES (CONT'D)

Other Than Established Airways or Routes

JO 7110.65, par. 6-5-4

Direct Courses At or Below FL600

- ⊙ Protect airspace for direct courses and course changes of 15 degrees or less:
 - Via NAVAIDs or radials FL600 and below
 - 4 miles on each side of the route to a point 51 miles from the NAVAID, then increasing in width on a 4.5-degree angle to a width of 10 miles on each side of the route at a distance of 130 miles from the NAVAID
-

PROTECTED AIRSPACE OF ROUTES AND COURSE CHANGES (CONT'D)

Degree-Distance Fixes - Military

JO 7110.65,
pars. 6-5-4, 4-4-3

Degree-Distance Fixes - Military

- ⊙ Protect airspace for direct courses and course changes of 15 degrees or less:
 - For aircraft flying via degree-distance fixes that are authorized under Degree-Distance Route Definition for Military Operations
 - Below FL180 - 4 miles on each side of the route
 - FL180 - FL600 - 10 miles on each side of the route
-

PROTECTED AIRSPACE OF ROUTES AND COURSE CHANGES (CONT'D)

Degree-Distance Fixes - RNAV Flights

JO 7110.65,
pars. 6-5-4, 4-4-3, 5-5-1

Degree-Distance Fixes - RNAV Flights

- ⦿ Protect airspace for direct courses and course changes of 15 degrees or less:
 - Via degree distance fixes for RNAV flights:
 - Above FL450 - 10 miles on each side of the route

NOTE: Radar separation must be applied to all RNAV aircraft operating at and below FL450 on Q routes or random RNAV routes, excluding oceanic airspace. An exception to this is GNSS-equipped aircraft /G, /L, /S, and /V on point-to-point routes, or transitioning between two point-to-point routes via an impromptu route.

PROTECTED AIRSPACE OF ROUTES AND COURSE CHANGES (CONT'D)

GNSS-RNAV Aircraft - Random RNAV Routes

JO 7110.65, par. 6-5-4

GNSS-RNAV Aircraft - Random RNAV Routes

- ⦿ Protect airspace for direct courses and course changes of 15 degrees or less
 - GNSS-equipped RNAV aircraft provided nonradar separation on random RNAV routes must be cleared via or reported to be established on point-to-point route segments
 - Points must be published NAVAIDs, waypoints, fixes, or airports recallable from the aircraft's navigation database
 - Points must be displayed on controller video maps or depicted on the controller chart displayed at the control position
 - The maximum distance between points must not exceed 500 miles
 - Protect 4 miles either side of the route centerline
 - Assigned altitudes must be at or above the highest MIA along the projected route segment being flown, including the protected airspace of that route segment

PROTECTED AIRSPACE OF ROUTES AND COURSE CHANGES (CONT'D)

GNSS-RNAV Aircraft- Transitioning Between Random Routes

JO 7110.65,
pars. 6-5-4, 4-4-
1

GNSS-RNAV Aircraft - Transitioning Between Random RNAV Routes

- ⦿ Protect airspace for direct courses and course changes of 15 degrees or less
 - GNSS-equipped RNAV aircraft being provided nonradar separation may be cleared via an impromptu route when the following conditions are met:
 - The impromptu route segment must not exceed the distance to the nearest available recallable fix/waypoint consistent with the direction of flight; *and*
 - Assigned altitudes must be at or above the highest MIA along the projected route segment being flown; *and*
 - Aircraft conducting the impromptu route must be separated vertically from other aircraft until established on the new point-to-point route

RANDOM IMPROMPTU ROUTE - A direct course initiated by ATC or requested by the pilot during flight. Aircraft are cleared from their present position to a NAVAID, waypoint, fix, or airport.

NOTE: For a random impromptu route, the present position is not a published NAVAID, waypoint, fix, or airport, but is the position at which the aircraft receives the clearance.

PROTECTED AIRSPACE OF ROUTES AND COURSE CHANGES (CONT'D)

Course Changes

JO 7110.65, par. 6-5-4

Protected Airspace

- ⊙ Protect airspace for course changes of 16° - 90°
 - Below FL180
 - 4 miles on each side of the route to a point 51 miles from the NAVAID, then increasing in width on a 4.5-degree angle to a maximum width of 10 miles on each side of the route at a distance of 130 miles from the NAVAID
 - FL180 - FL230
 - 14 miles on the overflown side
 - Above FL230 - FL600
 - 17 miles on the overflown side
 - After the course change is completed and the aircraft is back on course, use appropriate direct course minima

PROTECTED AIRSPACE OF ROUTES AND COURSE CHANGES (CONT'D)

Course Changes (Cont'd)

JO 7110.65, par. 6-5-4

- ⊙ Protect airspace for course changes of 91°- 180°
 - Below FL180
 - 4 miles on each side of the route to a point 51 miles from the NAVAID, then increasing in width on a 4.5-degree angle to a maximum width of 10 miles on each side of the route
 - FL180 - FL230
 - 28 miles on the overflown side
 - Above FL230 - FL600
 - 34 miles on the overflown side
 - After the course change is completed and the aircraft is back on course, use appropriate direct course minima
-

PROTECTED AIRSPACE OF ROUTES AND COURSE CHANGES (CONT'D)

Knowledge Check

Knowledge Check

GNSS equipped aircraft established on point-to-point route segments must be protected ____ miles either side of centerline.

- A. 4
- B. 6
- C. 10

 Lesson 2: Lateral Separation  18

Question: GNSS equipped aircraft established on point-to-point route segments must be protected ____ miles either side of centerline.

PROTECTED AIRSPACE OF ROUTES AND COURSE CHANGES *(CONT'D)*

Knowledge Check

Knowledge Check

What is the maximum number of miles protected on each side of a direct course below FL600?

- A. 4
- B. 10
- C. 17

 Lesson 2: Lateral Separation  19

Question: What is the maximum number of miles protected on each side of a direct course below FL600?

PROTECTED AIRSPACE OF ROUTES AND COURSE CHANGES (CONT'D)

Knowledge Check

Knowledge Check

When a course change is 16° through 90°, how many miles of airspace are to be protected on the overflown side for an aircraft at FL240?

- A. 10
- B. 14
- C. 17

Lesson 2: Lateral Separation

20

Question: When a course change is 16° through 90°, how many miles of airspace are to be protected on the overflown side for an aircraft at FL240?

PROTECTED AIRSPACE OF ROUTES AND COURSE CHANGES *(CONT'D)*

Knowledge Check

Knowledge Check

When a course change is 140°, how many miles are to be protected on the overflown side for an aircraft at FL220?

- A. 10
- B. 28
- C. 34

Lesson 2: Lateral Separation

21

Question: When a course change is 140°, how many miles are to be protected on the overflown side for an aircraft at FL220?

SEPARATION MINIMA ON DIVERGING RADIALS OR TRACKS

Separation Criteria

JO 7110.65, par. 6-5-2

Separation minima on Diverging Radials or Tracks

TRACK - The actual flight path of an aircraft over the surface of the earth.

- ⊙ Consider separation to exist between aircraft:
 - Established on diverging radials of the same NAVAID
 - At least 15° divergence when either aircraft is clear of the airspace to be protected for the other aircraft
 - With non-VOR/DME based navigational equipment established on diverging tracks of the same waypoint
 - At least 15° divergence when either aircraft is clear of the airspace to be protected for the other aircraft

SEPARATION MINIMA ON DIVERGING RADIALS (CONT'D)

Non-DME Divergence Distance Minima

JO 7110.65, par.
6-5-2, TBL 6-5-1

Non-DME Divergence Distance Minima	
Divergence (Degrees)	Distance (NM)
15	16
20	12
25	10
30	8
35	7
45	6
55	5
90	4

 Lesson 2: Lateral Separation 23

Non-DME Divergence Distance Minima Table

- ⊙ Used to determine the distance required for angles of divergence to clear protected airspace
 - For divergence that falls between two values, use the lesser divergence degree value to obtain the distance
- ⊙ May be used for aircraft that obtain mileages from sources other than DME, such as LORAN and GNSS, where there is no slant-range error

Non-DME Divergence Distance Minima	
Divergence (Degrees)	Distance (NM)
15	16
20	12
25	10
30	8
35	7
45	6
55	5
90	4

SEPARATION MINIMA ON DIVERGING RADIALS

(CONT'D)

DME Divergence Distance Minima

JO 7110.65, par.
6-5-2, TBL 6-5-2

FAA-H-8083-
25B

DME Divergence Distance Minima		
Divergence (Degrees)	Distance (NM)	
	Below FL180	FL180 - FL450
15	17	18
20	13	15
25	11	13
30	9	11
35	8	11
45	7	11
55	6	11
90	5	11

DME Divergence Distance Minima Table

- ⦿ Used to determine the distance required for angles of divergence to clear protected airspace
 - For divergence that falls between two values, use the lesser divergence degree value to obtain the distance
- ⦿ Compensates for DME slant-range error

SLANT RANGE - The horizontal distance from the aircraft antenna to the ground station, due to line-of-sight transmission of the DME signal.

DME Divergence Distance Minima		
Divergence (Degrees)	Distance (NM)	
	Below FL180	FL180 - FL450
15	17	18
20	13	15
25	11	13
30	9	11
35	8	11
45	7	11
55	6	11
90	5	11

SEPARATION MINIMA ON DIVERGING RADIALS

(CONT'D)

Knowledge Check

Knowledge Check

How do you determine the required lateral separation when divergence falls between two values listed in the divergence table?

- A. Take the average of the two values
- B. Use the greater divergence degree value
- C. Use the lesser divergence degree value

Lesson 2: Lateral Separation

25

Question: How do you determine the required lateral separation when divergence falls between two values listed in the divergence table?

SEPARATION MINIMA ON DIVERGING RADIALS

(CONT'D)

Knowledge Check

Knowledge Check

What is the total width of an airway, 40 miles from a VORTAC?

- A. 4 miles
- B. 8 miles
- C. 10 miles

Lesson 2: Lateral Separation

26

Question: What is the total width of an airway, 40 miles from a VORTAC?

SEPARATION MINIMA ON DIVERGING RADIALS

(CONT'D)

Knowledge Check

Knowledge Check

Why is DME mileage minima greater for DME divergence than non-DME divergence?

- A. There is no risk of equipment failure for non-DME
- B. DME accounts for slant-range error
- C. Non-DME uses TACAN signals only, so it is more accurate

Lesson 2: Lateral Separation

Question: Why is DME mileage minima greater for DME divergence than non-DME divergence?

DME ARC SEPARATION MINIMA

DME Arc Separation Minima

JO 7110.65, par. 6-5-3

DME arc separation minima

- ⊙ Apply lateral DME separation by requiring aircraft using DME to fly an arc about a NAVAID at a specified distance using the following minima:
 - At 35 miles or less from the NAVAID
 - 10 miles
 - More than 35 miles from the NAVAID
 - 20 miles
- ⊙ To assign a DME arc:

VIA (number of miles) MILE ARC (direction) OF (name of DME NAVAID)

Example: “N23E CLEARED VIA ONE FIVE MILE ARC NORTH OF THE RED BLUFF VORTAC”

DME ARC SEPARATION MINIMA (CONT'D)

DME ARC - Other Protected Airspace Minima

JO 7110.65, par.
6-5-3

DME Arc - Other Protected Airspace Minima

⊙ DME arc about a NAVAID and other airspace to be protected:

- 35 miles or less from the NAVAID
 - 5 miles
- More than 35 miles from the NAVAID
 - 10 miles

NOTE: The other airspace to be protected may be a MOA, a holding pattern airspace area, airway or route, ATCAA, warning area, restricted area, prohibited area, etc.

DME ARC SEPARATION MINIMA (CONT'D)

Knowledge Check

Knowledge Check

What is the required separation minimum between the protected airspace of a holding pattern and an aircraft on a DME arc 40 NM from the NAVAID?

- A. 5 NM
- B. 10 NM
- C. 20 NM

Lesson 2: Lateral Separation

Question: What is the required separation minimum between the protected airspace of a holding pattern and an aircraft on a DME arc 40 NM from the NAVAID?

DME ARC SEPARATION MINIMA (CONT'D)

Knowledge Check

Knowledge Check

What is the lateral separation minimum required between two DME arcs being flown within 35NM of the NAVAID?

- A. 5 NM
- B. 10 NM
- C. 20 NM

Lesson 2: Lateral Separation

Question: What is the lateral separation minimum required between two DME arcs being flown within 35NM of the NAVAID?

DME ARC SEPARATION MINIMA (CONT'D)

Knowledge Check

Knowledge Check

What separation is required between two DME arcs when one aircraft is more than 35 NM from the NAVAID and one aircraft is less?

- A. 5 NM
- B. 10 NM
- C. 20 NM

Lesson 2: Lateral Separation

32

Question: What separation is required between two DME arcs when one aircraft is more than 35 NM miles from the NAVAID and one aircraft is less?

CONCLUSION

Lesson Summary

Lesson Summary

- Lateral separation methods
- Protected airspace of routes and course changes
- Separation minima on diverging radials or tracks
- DME arc separation minima

 Lesson 2: Lateral Separation 33

Summary

- ⊙ Lateral separation methods
 - Separation by geographical location
 - Separation in holding patterns
 - Separation between holding patterns and airways/routes
 - Departure divergence
 - ⊙ Protected airspace of routes and course changes
 - Established airways/routes
 - Direct flights at or below FL600
 - Degree distance fixes
 - Course changes
 - ⊙ Separation minima on diverging radials or tracks
 - Divergence distance minima
 - Non-DME divergence distance minima
 - ⊙ DME arc separation minima
 - Separation of DME arcs
 - Minima between an arc and other protected airspace
-
